## Operations Documentation

### Daily Operations

#### Health Checks

##### 1. Application Status

```
curl -s -o /dev/null -w "%{http_code}" https://taxplanner.app/
# Expected: 200
```

##### 2. ALB Health

- Check AWS Console | EC2 | Target Groups | hipaa-poc-tg
- All targets should be “healthy”

##### 3. CloudWatch Logs

```
aws logs tail /hipaa-poc/application --since 1h --region us-east-2
```

### Connecting to EC2

#### Via SSM Session Manager

```
# From AWS CLI
aws ssm start-session --target i-0500bfb3b4ad44e24 --region us-east-2

# Once connected
sudo su -
cd /app
docker compose ps
```

#### Via AWS Console

1. Go to EC2 | Instances
2. Select the instance
3. Click “Connect” | “Session Manager” | “Connect”

## Application Management

### View Container Status

```
cd /app  
docker compose ps
```

### View Application Logs

```
docker compose logs -f php  
docker compose logs -f nginx
```

### Restart Application

```
cd /app  
docker compose restart
```

### Update Application

```
cd /app  
git pull origin main  
docker compose down  
docker compose up -d --build
```

## View Database

```
sqlite3 /data/db/app.sqlite  
.tables  
SELECT * FROM users;  
SELECT * FROM messages ORDER BY created_at DESC LIMIT 10;  
SELECT * FROM audit_log ORDER BY created_at DESC LIMIT 20;  
.quit
```

## Backup Operations

### Manual Backup

```
/usr/local/bin/backup-db.sh
```

### List Backups

```
aws s3 ls s3://hipaa-poc-backups-730543776652/backups/ --region us-east-2
```

### Download Backup

```
aws s3 cp s3://hipaa-poc-backups-730543776652/backups/db_20260131_020000.sqlite.gz /tmp/ --reg  
gunzip /tmp/db_20260131_020000.sqlite.gz
```

### Restore from Backup

```
# Stop application  
cd /app
```

```

docker compose down

# Backup current database
cp /data/db/app.sqlite /data/db/app.sqlite.old

# Restore from backup
aws s3 cp s3://hipaa-poc-backups-730543776652/backups/db_YYYYMMDD_HHMMSS.sqlite.gz /tmp/
gunzip /tmp/db_YYYYMMDD_HHMMSS.sqlite.gz
cp /tmp/db_YYYYMMDD_HHMMSS.sqlite /data/db/app.sqlite
chown 1000:1000 /data/db/app.sqlite

# Start application
docker compose up -d

```

## Secrets Management

### View Current Secrets

```

aws secretsmanager get-secret-value \
--secret-id hipaa-poc/app-secrets \
--region us-east-2 \
--query SecretString \
--output text | jq .

```

### Update Secrets

1. Update in AWS Secrets Manager:

```

aws secretsmanager update-secret \
--secret-id hipaa-poc/app-secrets \
--secret-string '{"GOOGLE_CLIENT_ID":"new-id","GOOGLE_CLIENT_SECRET":"new-secret",...}' \
--region us-east-2

```

2. Restart EC2 or re-deploy to load new secrets:

```

# On EC2
cd /app
# Re-fetch secrets and update .env
SECRET_JSON=$(aws secretsmanager get-secret-value --secret-id hipaa-poc/app-secrets --region us-east-2)
# Update .env file accordingly
docker compose restart

```

## Terraform Operations

### Initialize (New Machine)

```

cd terraform
terraform init

```

### Plan Changes

```

terraform plan

```

## Apply Changes

```
terraform apply
```

## View Current State

```
terraform show  
terraform output
```

## Import Existing Resource

```
terraform import aws_instance.app i-0500bfb3b4ad44e24
```

## Monitoring

### CloudWatch Metrics

Key metrics to monitor:

- EC2: CPUUtilization, StatusCheckFailed
- ALB: HealthyHostCount, RequestCount, TargetResponseTime
- NAT Gateway: BytesOutToDestination

### CloudWatch Alarms (Recommended)

```
# Example: ALB unhealthy hosts alarm  
aws cloudwatch put-metric-alarm \  
  --alarm-name hipaa-poc-unhealthy-hosts \  
  --metric-name UnHealthyHostCount \  
  --namespace AWS/ApplicationELB \  
  --statistic Average \  
  --period 60 \  
  --threshold 1 \  
  --comparison-operator GreaterThanOrEqualToThreshold \  
  --evaluation-periods 2 \  
  --dimensions Name=TargetGroup,Value=targetgroup/hipaa-poc-tg/xxx \  
  --alarm-actions arn:aws:sns:us-east-2:730543776652:alerts \  
  --region us-east-2
```

## Troubleshooting

### Application Not Loading

1. Check EC2 status:

```
aws ec2 describe-instance-status --instance-ids i-0500bfb3b4ad44e24 --region us-east-2
```

2. Check target group health:

```
aws elbv2 describe-target-health --target-group-arn <tg-arn> --region us-east-2
```

3. Connect via SSM and check containers:

```
docker compose ps  
docker compose logs
```

## OAuth Login Failed

1. Check redirect URI matches in Google Console
2. Verify secrets in Secrets Manager
3. Check .env file on EC2:

```
cat /app/.env
```

## Database Issues

1. Check database file exists:

```
ls -la /data/db/
```

2. Check permissions:

```
ls -la /data/db/app.sqlite  
# Should be owned by 1000:1000
```

3. Test database:

```
sqlite3 /data/db/app.sqlite "SELECT COUNT(*) FROM users;"
```

## SSL Certificate Issues

1. Check certificate status:

```
aws acm describe-certificate --certificate-arn <cert-arn> --region us-east-2
```

2. Verify DNS validation record exists

3. Check certificate is attached to ALB listener

## Scaling (Future)

### Horizontal Scaling

To scale horizontally: 1. Create AMI from current EC2 2. Create Auto Scaling Group 3. Update ALB target group to use ASG 4. Migrate database to RDS or MongoDB Atlas

### Vertical Scaling

To increase instance size: 1. Update `instance_type` in `terraform.tfvars` 2. Run `terraform apply` 3. Instance will be replaced (brief downtime)

## Disaster Recovery

### RTO/RPO

Metric	Target
RTO (Recovery Time Objective)	1 hour
RPO (Recovery Point Objective)	24 hours (daily backups)

## Recovery Procedure

1. If EC2 fails:
  - Terraform will recreate from scratch
  - Restore database from S3 backup
2. If region fails:
  - Deploy to new region using Terraform
  - Update DNS to new ALB
  - Restore database from S3 (cross-region replication recommended for production)

## Full Recovery Steps

```
# 1. Deploy infrastructure
cd terraform
terraform init
terraform apply

# 2. Wait for EC2 to initialize (check user-data logs)
aws ssm start-session --target <new-instance-id> --region us-east-2
tail -f /var/log/user-data.log

# 3. Restore database from backup
/usr/local/bin/restore-db.sh <backup-file>

# 4. Verify application
curl https://taxplanner.app/
```

## Maintenance Windows

### Recommended Schedule

Task	Frequency	Window
OS Updates	Monthly	Sunday 2-4 AM
Application Updates	As needed	Off-peak hours
Backup Verification	Weekly	N/A
Security Review	Monthly	N/A

## Applying OS Updates

```
# Connect to EC2
aws ssm start-session --target i-0500bfb3b4ad44e24 --region us-east-2

# Update packages
sudo dnf update -y

# Reboot if kernel updated
sudo reboot
```
